Tie between Morgellons Disease and fungi?

"Dr. Kalani said the fibers from Morgellons patients were fungal. Because the body becomes like soil, fungus is attracted. The fibers are coated with the Agobacterium, which is a pathogenic fungus also known as Agent Green. Whether it is getting in the lungs, being ingested, or is vector borne or transmitted sweat to sweat is the big question..." (Natural News)

It is important to know that we do not hear from most mold-ill people that they have Morgellons. However, we often hear of skin lesions and from some, that mold-ill people were also diagnosed with Morgellons, after occupying moldy buildings. This article advises early diagnosis and treatment. Morgellons: Expert Says Awareness and Early Treatment are Paramount

Friday, March 06, 2009 by: Barbara Minton, Natural Health Editor

(An Interview with Trisha Springstead, RN, a Morgellon's expert)

Some quotes: (click the article title for full article)

"Morgellons is a terrifying disease reaching pandemic status. Yet because the symptoms of the disease are so bizarre, people who have it tend to withdraw and become isolated from society. With mysterious fibers and parasites coming through lesions in their skin, Morgellons sufferers often live in fear....

Vitaly Citovsky at Stonybrook in New York studied the fibers of 10 patients and said they had Agrobacterium Tumafaciens in their bodies (the bacterium that causes crown gall disease in plants), but what amazed him the most was that he found a biofilm on the skins of these people. It is almost like a pseudo skin. We have to penetrate that biofilm and draw this stuff out of the body or these people will never get better. If you don't, it will stay in the skin and get worse...

..."most practitioners continue to view it as isolated instances of delusional parasitosis. " (SMH Note: delusional: even when these can be seen with the naked eye and inspected under microscopes!)

Dr. Kalani said the fibers from Morgellons patients were fungal. Because the body becomes like soil, fungus is attracted. The fibers are coated with the Agobacterium, which is a pathogenic fungus also known as Agent Green. Whether it is getting in the lungs, being ingested, or is vector borne or transmitted sweat to sweat is the big question...

My source at CDC told me that this is the most reported disease entity since the reports of HIV/AIDS. And yet so

many people have not reported out of fear. The CDC wants to keep it quiet because they are afraid of mass hysteria and mass pandemonium.

I took slides to my friend who is an entomologist and we found fungal hyphae, alternarium, and pathogenic funguses on the slides. These are not things that grow in humans. They are organisms that grow in plants. So the human bodies of these sufferers are becoming like soil and that does that attract? Fungus, mold and parasites."
